**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## **Closure of a hyperextended system in an orogenic lithospheric pop-up, Western Pyrenees: The role of mantle buttressing and rift structural inheritance**

The Early Cretaceous hyperextended Mauléon rift is localized in the north-western Pyrenean orogen. We infer the Tertiary evolution of the Mauléon basin through the restoration of a 153 km-long crustal-scale balanced cross-section of the Pyrenean belt, which documents at least 67 km (31%) of orogenic shortening in the Western Pyrenees. Initial shortening, accommodated through inversion of inherited crustal structures, led to formation of a pop-up structure, in which the opposite edges underwent similar shortening with different tectonic reactivation styles, localized versus distributed. Underthrusting of the Iberian margin accommodated further convergence, forming the Axial Zone antiformal stack of crustal nappes within a lithospheric pop-up. Thin-skinned and thick-skinned structures propagated outward

from the heart of this pop-up, a block of strong mantle acting as a buttress inhibiting complete inversion of the Mauléon rift basin.

This work is part of the OROGEN project, cofunded by Total S.A., BRGM and Institut national de sciences de l'Univers (INSU).

**Mots-Clés :** Lithospheric pop-up, mantle buttress, Mauleon hyperextended basin inversion
